Matt,

Here are a couple shots from Wednesday at the Gold King mine. The significance of the rock face view is the shallow nature of the overburden before encountering fractured rock. The estimate from Bruce was 25 feet of colluvium. Also, the flow is exceptionally low from the adit whereas normally it is about 50 – 100 gpm in this time of year.

Also, the only information available on the tunnel dimensions suggests it may be an 8 x 8 opening with flat roof/back.

Steve
